User accounts and audit log - ERD

SQLite stores account metadata and history. Ciphered password files remain outside SQLite.

users

PK username: TEXT NOT NULL
is_admin: INTEGER NOT NULL DEFAULT 0
Case-sensitive username identity.
0 = standard; nonzero = admin.
No password column.

1 user : 0..* audit events

audit_log

PK id: INTEGER AUTOINCREMENT
FK username: TEXT NOT NULL -> users.username
action: TEXT NOT NULL
content_type: TEXT NOT NULL
content_identifier: TEXT NOT NULL
accessed_at: TEXT NOT NULL
LocalDateTime encoded as ISO text.
Events retrieved in generated ID order.

Separate ciphered files (not a SQLite entity)

credentials-<lowercase hex of UTF-8 username>.cip
Examples: Agent -> credentials-4167656e74.cip; agent -> credentials-6167656e74.cip.
FileHandler writes Cipher.cipher("PWD:" + password + ":END"); login deciphers and compares the framed value.
Audit username must exist in users. No foreign key to content: identifiers refer to multiple content types.
Metadata and file writes are not atomic. After a failed first password write, recover with setInitialPassword().
